A11	Longest defrosting	7 min			

# Safety information

This appliance is designed for use in a home environment and not intended to be used by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety. This in accordance to applicable parts of the low-voltage directive 2006/95/EC, LVD. The appliance is also intended for use by experts or trained users in shops, hotels, light industry, on farms and in similar environments. This in accordance to applicable parts of the machinery directive 2006/42/EC.

Children should be supervised to ensure that they do not play with the appliance.

This is an original instruction manual. Translation is not allowed without approval from NIBE.

Rights to make any design or technical modifications are reserved.

©NIBE 2011.

## Symbols

### NOTE

This symbol indicates danger to machine or person.

### Caution

This symbol indicates important information about what you should observe when maintaining your installation.

### TIP

This symbol indicates tips on how to facilitate using the product.

## Marking

F2300 is CE marked and fulfils IP24.

The CE marking means that NIBE ensures that the product meets all regulations that are placed on it based on relevant EU directives. The CE mark is obligatory for most products sold in the EU, regardless where they are made.

IP24 means that the product is secure against penetration by objects with a diameter larger than or equivalent to 12.5 mm and that the product is protected against drops from all directions.

# Safety precautions

## Caution

### **The installation must be carried out by a qualified installer.**

If you install the system yourself, serious problems may occur, for example water leaks, refrigerant leaks, electric shocks, fire and personal injury, as a result of a system malfunction.

### **Use original accessories and the stated components for the installation.**

If parts other than those stated by us are used, water leaks, electric shocks, fire and personal injury may occur as the unit may not work properly.

### **Install the unit in a location with good support.**

Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury. Installation without sufficient support can also cause vibrations and noise.

### **Ensure that the unit is stable when installed, so that it can withstand earthquakes and strong winds.**

Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury.

### **The electrical installation must be carried out by a qualified electrician and the system must be connected as a separate circuit.**

Power supply with insufficient capacity and incorrect function can cause electric shocks and fire.

### **Do not perform any repairs yourself. Consult the dealer if the system requires repair.**

Incorrectly performed repairs can cause water leakage, refrigerant leakage, electric shocks or fire.

### **Consult the dealer or an expert regarding removal of the heat pump.**

Incorrect installation can cause water leakage, refrigerant leaks, electric shocks or fire.

### **Switch off the power supply in the event of a service or inspection.**

If the power supply is not shut off, there is a risk of electric shocks and damage due to the rotating fan.

### **Do not run the unit with removed panels or protection.**

Touching rotating equipment, hot surfaces or high voltage parts can cause personal injury due to entrapment, burns or electric shocks.

### **Cut the power before starting electrical work.**

Failure to cut the power can cause electric shocks, damage and incorrect function of the equipment.

## Care

### **Do not use the unit where water splashes may occur, for example in laundries.**

The indoor section is not waterproof and electric shocks and fire can therefore occur.

### **Do not use the unit for specialist purposes such as for storing food, cooling precision instruments, freeze-conservation of animals, plants or art.**

This can damage the items.

### **Do not install the outdoor unit in the locations stated below.**

- Locations where leakage of combustible gas can occur.
- Locations where carbon fibre, metal powder or other powder that can enter the air.
- Locations where substances that can affect the unit, for example, sulphide gas, chlorine, acid or alkaline substances can occur.
- Locations with direct exposure to oil mist or steam.
- Vehicles and ships.
- Locations where machines that generate high frequency harmonics are used.
- Locations where cosmetic or special sprays are often used.

- Locations that can be subjected to direct salty atmospheres. In this case, the outdoor unit must be protected against direct intakes of salty air.
- Locations where large amounts of snow occur.
- Locations where the system is exposed to chimney smoke.

**If the bottom frame of the outdoor section is corroded, or in any other way damaged, due to long periods of operation, it must not be used.**

Using an old and damaged frame can cause the unit to fall and cause personal injury.

**Do not allow the drainage pipe to exit into channels where poisonous gases, containing sulphides for example, can occur.**

If the pipe exits into such a channel, any poisonous gases will flow into the room and seriously affect the user's health and safety.

**Insulate the unit's connection pipes so that the ambient air moisture does not condense on them.**

Insufficient insulation can cause condensation, which can lead to moisture damage on the roof, floor, furniture and valuable personal property.

**Do not install the outdoor unit in a location where insects and small animals can inhabit.**

Insects and small animals can enter the electronic parts and cause damage and fire. Instruct the user to keep the surrounding equipment clean.

**Dispose of any packaging material correctly.**

Any remaining packaging material can cause personal injury as it may contain nails and wood.

**Do not touch any buttons with wet hands.**

This can cause electric shocks.

**Do not shut off the power supply immediately after operation has started.**

Wait at least 5 minutes, otherwise there is a risk of water leakage or breakdown.

**Do not control the system with the main switch.**

This can cause fire or water leakage. In addition, the fan can start unexpectedly, which can cause personal injury.

## Serial number

The serial number can be found at the top left of the rear cover and on the foot of the product.

### Caution

Always give the product's serial number when reporting a fault.

## F2300 - An excellent choice

F2300 is an air/water heat pump specially developed for the Nordic climate, which utilises the outside air so there is no need for bore holes or coils in the ground.

The heat pump is intended for connection to water borne heating systems and can both heat hot water effectively at high outdoor temperatures and give a high output to the heating system at low outdoor temperatures.

If the outdoor temperature drops to a level below the stop temperature all heating must then occur with external additional heat.

### **Excellent properties for F2300:**

- ***Efficient scroll compressor***

New efficient scroll compressor that operates at temperatures down to -25°C.

- ***Intelligent control***

Integrated intelligent control for optimum control of the heat pump. At a start signal from an NIBE indoor module or thermostat F2300 is started.

- ***Fan***

F2300 has an automatic 2-step capacity regulator for the fan.

- ***Long service life***

The material has been chosen for a long service life and is designed to withstand the Nordic outdoor conditions.

- ***Many possibilities***

F2300 can also be used together with most electric boilers, oil boilers or similar.

# 2 The heat pump – the heart of the house

## Heat pump function

The temperatures are only examples and may vary between different installations and time of year.

An air/water heat pump can use the outdoor air to heat a property. The conversion of the outdoor air's energy to property heating occurs in three different circuits. In the brine circuit, (1), free heat energy is retrieved from the surroundings and transported to the heat pump. In the refrigerant circuit, (2), the heat pump increases the retrieved heat's low temperature to a high temperature. In the heating medium circuit, (3), the heat is distributed around the house.

### **Outdoor air**

- A** The outdoor air is sucked into the heat pump.
- B** The fan then routes the air to the heat pump's evaporator. Here, the air releases the heating energy to the refrigerant and the air's temperature drops. The cold air is then blown out of the heat pump.

### **Refrigerant circuit**

- C** A gas circulates in a closed system in the heat pump, a refrigerant, which also passes the evaporator. The refrigerant has a very low boiling point. In the evaporator the refrigerant receives the heat energy from the outdoor air and starts to boil.
- D** The gas that is produced during boiling is routed into an electrically powered compressor. When the gas is compressed, the pressure increases and the gas's temperature increases considerably, from 5 °C to approx. 80°C.
- E** From the compressor, gas is forced into a heat exchanger, condenser, where it releases heat energy to the heating system in the house, whereupon the gas is cooled and condenses to a liquid form again.
- F** As the pressure is still high, the refrigerant can pass an expansion valve, where the pressure drops so that the refrigerant returns to its original temperature. The refrigerant has now completed a full cycle. It is routed to the evaporator again and the process is repeated.

### **Heat medium circuit**

- G** The heat energy that the refrigerant produces in the condenser is retrieved by the climate system's water, heating medium, which is heated to 55 °C (supply temperature).
- H** The heating medium circulates in a closed system and transports the heated water's heating energy to the house water heater and radiators/heating coils.

The temperatures are only examples and may vary between different installations and time of year.

## Contact with F2300

F2300 has an integrated control system that checks and monitors the heat pump operation. At installation the installer makes the necessary settings of the control system so that the heat pump will work optimally in your system.

The heat pump is controlled in different ways depending on what your system looks like. If you have a NIBE indoor module heat pump operation can be controlled from there. Refer to the relevant manual for further information.

# Maintenance of F2300

## Regular checks

When your heat pump is located outdoors some external maintenance is required.

### NOTE

Insufficient oversight can cause serious damage to F2300 which is not covered by the guarantee.

### Checking grilles

Check that the inlet grille is not clogged by leaves, snow or anything else regularly throughout the year.

Pay extra attention in event of high winds or snowfall that may cause the grille to be blocked.

Prevent snow building up and covering the grille on F2300.

Keep free of snow and/or ice.

### ***Cleaning the outer casing***

If necessary the outer casing can be cleaned using a damp cloth.

Care must be exercised so that the heat pump is not scratched when cleaning. Avoid spraying water into the grilles or the sides so that water penetrates into F2300. Prevent F2300 coming into contact with alkaline cleaning agents.

### ***Condensation water trough***

The trough and drain pipe may require cleaning from leaves or similar during the year.

#### ***Cleaning***

1. Use the safety switch to cut the incoming electrical supply.
2. Release the trough using the quick release catches on the left and right front edges. Keep in position at the rear edge without stretching the power cable.
3. Clean trough and drain.
4. Reinstall the trough using the removal method in reverse order (see point 2).
5. Switch on the safety switch again.

### **In event of long power cuts**

In the event of prolonged power failures it is recommended that the part of the heating system located outdoors is drained. Your installer has installed a shut off and drain valve to facilitate this. Call and ask your installer if you are unsure.

### **Saving tips**

Your heat pump installation produces heat and/or hot water. This occurs via the control settings you made.

Factors that affect the energy consumption are, for example, indoor temperature, hot water consumption, the insulation level of the house and whether the house has many large window surfaces. The position of the house, e.g. wind exposure is also an affecting factor.

Also remember:

- Open the thermostat valves completely (except those thermostats in the rooms that are to be kept cooler for various reasons, e.g. bedrooms). The thermostats slow the flow in the heating system, which the heat pump wants to compensate with increased temperatures. It then works harder and consumes more electrical energy.

- Reduce or adjust the settings for heating in any external control systems.

### **Power consumption**

% of annual consumption The air/water heat pump's energy distribution spread across the year

Increasing the indoor temperature one degree increases power consumption by approx. 5%.

### **Domestic electricity**

In the past it has been calculated that an average Swedish household has an approximate annual consumption of 5000 kWh domestic electricity/year. In today's society it is usually between 6000-12.000 kWh/year.

Equipment	Normal Output (W)		Approximate annual consumption (kWh)
	Operation	Standby	
Flat-screen (Operation: 5 h/day, Standby: 19 h/day)	200	2	380
Digital box (Operation: 5 h/day, Standby: 19 h/day)	11	10	90
DVD (Operation: 2 h/week)	15	5	45
TV games console (Operation: 6 h/week)	160	2	67
Radio/stereo (Operation: 3 h/day)	40	1	50

Equipment	Normal Output (W)		Approximate annual consumption (kWh)
Computer incl. screen (Operation: 3 h/day, standby 21 h/day)	100	2	120
Bulb (Operation 8 h/day)	60	-	175
Spot light, Halogen (Operation 8 h/day)	20	-	55
Cooler (Operation: 24 h/day)	100	-	165
Freezer (Operation: 24 h/day)	120	-	380
Oven, hob (Operation: 40 min/day)	1500	-	365
Oven (Operation: 2 h/week)	3000	-	310
Dishwasher, cold water connection (Operation 1 time/day)	2000	-	730
Washing machine (Operation: 1 time/day)	2000	-	730
Tumble drier (Operation: 1 time/day)	2000	-	730
Vacuum cleaner (Operation: 2 h/week)	1000	-	100
Engine block heater (Operation: 1 h/day, 4 months a year)	400	-	50
Passenger compartment heater (Operation: 1 h/day, 4 months a year)	800	-	100

These values are approximate example values.

Example: A family with 2 children live in a house with 1 flat-screen TV, 1 digital box, 1 DVD player, 1 TV games console, 2 computers, 3 stereos, 2 bulbs in the WC, 2 bulbs in the bathroom, 4 bulbs in the kitchen, 3 bulbs outside, a washing machine, tumble drier, fridge, freezer, oven, vacuum cleaner, engine block heater = 6240 kWh domestic electricity/year.

### **Energy meter**

Check the accommodation's energy meter regularly, preferably once a month. This will indicate any changes in power consumption.

Newly built houses usually have twin energy meters, use the difference to calculate your domestic electricity.

### ***New builds***

Newly built houses undergo a drying out process for a year. The house can then consume significantly more energy than it would thereafter. After 1-2 years the heating curve should be adjusted again, as well as the heating curve offset and the building's thermostat valves, because the heating system, as a rule, requires a lower temperature once the drying process is complete.

# 3 Disturbances in comfort

## Troubleshooting

### NOTE

Work behind covers secured by screws may only be carried out by, or under the supervision of, a qualified installation engineer.

### NOTE

As F2300 can be connected to a large number of external units, these should also be checked.

### NOTE

If the operating disturbance cannot be rectified by means of this chapter, an installation engineer should be called.

### NOTE

In the event of action to rectify malfunctions that require work within screwed hatches the incoming electricity must be isolated at the safety switch.

The following tips can be used to rectify comfort disruption:

### Basic actions

Start by checking the following possible fault sources:

- That the heat pump is running or that the supply cable to F2300 is connected.
- Group and main fuses of the accommodation.
- The property's earth circuit breaker.

### Low hot water temperature or a lack of hot water

This part of the fault-tracing chapter only applies if the heat pump is docked to the hot water heater.

- Large hot water consumption.
  - Wait until the hot water has heated up.

- Incorrect settings in the NIBE indoor module.
  - See the manual for the indoor module.

### **Low room temperature**

- Closed thermostats in several rooms.
  - Set the thermostats to max in as many rooms as possible.
- External switch for changing the room heating activated.
  - Check any external switches.
- Incorrect settings in the NIBE indoor module.
  - See the manual for the indoor module.

### **High room temperature**

- External switch for changing the room heating activated.
  - Check any external switches.
- Incorrect settings in the NIBE indoor module.
  - See the manual for the indoor module.

### **F2300 is not operational**

- External control equipment has not given the start signal.
  - Check the settings on the control equipment.
- Fuses have tripped.
  - Replace the fuse or reset the MCB. If the fuse trips again the installation engineer should be contacted.
- Cold outdoor air.
  - Wait until the ambient temperature is 2 °C higher than the heat pump's set stop value.
- Tripped high pressure pressostat.
  - Check that the system has been vented correctly. Check the fuses. Check that the particle filter is not blocked. Check that the circulation pump is rotating. If the fault remains contact the installation engineer.
- Tripped low pressure switch.
  - Ensure that the air flow is not blocked. If the fault remains contact the installation engineer.
- Ambient temperature is hotter than 40 °C.
  - Wait until the ambient temperature is colder than 38.0 °C.
- Low evaporation temperature.

- Ensure that the air flow is not blocked. If the fault remains contact the installation engineer.
- Fan stopped.
  - Ensure that the air flow is not blocked. If the fault remains contact the installation engineer.
- Time conditions do not permit start.
  - Wait until the set conditions have run out.

### **Ice build up in the fan collar**

Contact your installer!

### **Ice build up on the fan blades and front grille**

Contact your installer!

# 4 Technical data

Detailed technical specifications for this product can be found in the installation manual ([www.nibe.eu](http://www.nibe.eu)).

# 5 Glossary

## **Additional heat:**

The additional heat is the heat produced in addition to the heat supplied by the compressor in your heat pump. Additional heaters can be for example, immersion heater, electric heater, solar power system, gas/oil/pellet/wood burner or district heating.

## **Ambient temperature sensor**

A sensor that is located outdoors on or close to the heat pump. This sensor tells the heat pump how hot it is where the sensor is located.

## **Balance temperature**

The balance temperature is the outdoor temperature when the heat pump's stated output is equal to the building's output requirement. This means that the heat pump covers the whole building's output requirement down to this temperature.

## **Charge coil**

A charge coil heats the domestic hot water (tap water) in the heater with heating water from F2300.

## **Charge pump**

See "Circulation pump".

## **Circulation pump**

Pump that circulates liquid in a pipe system.

## **Climate system**

Climate systems can also be called heating systems. The building is heated using radiators, under floor coils or convector fans.

## **Coil tank**

A heater with a coil in it. The water in the coil heats the water in the heater.

## **Compressor**

Compresses the gas state refrigerant. When the refrigerant is compressed, the pressure and the temperature increase.

## **Condenser**

Heat exchanger where the hot gas state refrigerant condenses (cooled and becomes a liquid) and releases heat energy to the house heating and hot water systems.

## **COP**

If it is stated that a heat pump has COP 4, this means, in principle that if you insert 10 pence, you will get 40 pence worth of heat. It is the efficiency of the heat pump. This is measured at different measurement values, e.g.: 7/45 where 7 stands for the outdoor temperature and 45 for how many degrees the supply temperature is.

## **Disturbances in comfort**

Disturbances in comfort are undesirable changes to the hot water/indoor comfort, for example when the temperature of the hot water is too low or if the indoor temperature is not at the desired level.

A malfunction in the heat pump can sometimes be noticed in the form of a disturbance in comfort.

In most cases, the heat pump notes operational interference and indicates this with alarms and shows instructions in the display.

## **Domestic hot water**

The water one showers in for example.

## **Double-jacketed tank**

A heater with domestic hot water (tap water) is surrounded by an outer vessel with boiler water (to the house radiators/elements). The heat pump heats the boiler water, which in addition to going out to the all the house radiators/elements, heats the domestic hot water in the inner vessel.

## **Efficiency**

A measurement of how effective the heat pump is. The higher the value is the better it is.

## **Electrical addition**

This is electricity that, for example, an immersion heater uses as addition during the coldest days of the year to cover the heating demand that the heat pump cannot manage.

## **Evaporator**

Heat exchanger where the refrigerant evaporates by retrieving heat energy from the air which then cools.

## **Expansion valve**

Valve that reduces the pressure of the refrigerant, whereupon the temperature of the refrigerant drops.

## **Expansion vessel**

Vessel with heating medium fluid with the task of equalising the pressure in the heating medium system.

## **Flow pipe**

The line in which the heated water is transported from the heat pump out to the house heating system (radiators/heating coils).

## **Heat exchanger**

Device that transfers heat energy from one medium to another without mixing mediums.

## **Heat factor**

Measurement of how much heat energy the heat pump gives off in relation to the electric energy it needs to operate. Another term for this is COP.

## **Heating medium**

Hot liquid, usually normal water, which is sent from the heat pump to the house climate system and makes the accommodation warm. The heating medium also heats the hot water.

## **Heating medium side**

Pipes to the house's climate system make up the heating medium side.

## **Hot water heater**

Container where domestic water is heated. Is located somewhere outside the heat pump.

## **Pressostat**

Pressure switch that triggers an alarm and/or stops the compressor if non-permitted pressures occur in the system. A high pressure pressostat trips if

the condensing pressure is too great. A low pressure pressostat trips if the evaporation pressure is too low.

### **Radiator**

Another word for heating element. They must be filled with water in order to be used with F2300.

### **Refrigerant**

Substance that circulates around a closed circuit in the heat pump and that, through pressure changes, evaporates and condenses. During evaporation, the refrigerant absorbs heating energy and during condensing, gives off heating energy.

### **Return pipe**

The line in which the water is transported back to the heat pump from the house heating system (radiators/heating coils).

### **Return temp**

The temperature of the water that returns to the heat pump after releasing the heat energy to the radiators/heating coils.

### **Safety valve**

A valve that opens and releases a small amount of liquid if the pressure is too high.

### **Shuttle valve**

A valve that can send liquid in two directions. A shuttle valve that enables liquid to be sent to the climate system, when the heat pump produces heating for the house, and to the hot water heater, when the heat pump produces hot water.

### **Supply temperature**

The temperature of the heated water that the heat pump sends out to the heating system. The colder the outdoor temperature, the higher the supply line temperature becomes.
